

Drains

Drains

The use of postoperative drains depends on the operation performed. Drain output should initially be documented at least hourly or more regularly in the event of concern regarding high drain output. Given the heterogeneity of drainage systems available it is paramount that nursing staff are familiar with the system used. The exact location and size of any drains should be clearly documented in the operation notes and the tubing labelled accordingly. This avoids inadvertent removal of the wrong drain or confusion for the ward team. Continued blood loss from a drain is an indication for re-exploration and should be immediately highlighted to the operating surgeon.
