

Risks of craniotomy

Risks of craniotomy

The risks associated with craniotomy are important to appreciate in discussing operations with patients and family, and in evaluating patients who deteriorate postoperatively. Specific risks depend on the anatomy of each approach. The following figures quoted in brackets will vary significantly between individual procedures and even between centres: - /uni25CF infection (5%) and wound breakdown; /uni25CF intracerebral haemorrhage; - /uni25CF seizures; - /uni25CF CSF leak; /uni25CF permanent neurological deficit; - /uni25CF death (1%). Risks of craniotomy
